Tuning out the reactance is important because a tuned antenna will accept and radiate much more power than a mismatched antenna. We will talk about how to build and optimize a coil later, in the Antenna Tuners chapter of this Handbook. When the loading coil is installed at the bottom of the vertical radiator, we call it a "base loaded" antenna.

Dipole antennas often are the easiest to build, and then turned into inverted V antennas by raising the center of the antennas up into the inverted V style. It's a good idea to have your antenna at least one half ( 1/2 ) wavelength of the antenna. one quarter (1/4) wave is the minimum height above ground for effective performance.

The antenna equations which follow relate to Figure 1 as a typical antenna. In Figure 1, BW N is the azimuth beamwidth and BW 2 is the elevation beamwidth. Beamwidth is normally measured at the half-power or -3 dB point of the main lobe unless otherwise specified. See Glossary.
