Answered: What happens to the immune system of a... | bartleby

(Opportunistic infections are infections and infection-related cancers that occur more frequently or are more severe in people with weakened immune systems than in people with healthy immune systems.) People with HIV are diagnosed with AIDS if they have a CD4 count of less than 200 cells/mm³ or if they have certain opportunistic infections. Once a person is diagnosed with AIDS, they can have a high viral load and are able to transmit HIV to others very easily.

The Stages of HIV Infection

certain opportunistic infections. People with AIDS can have a high viral load and be very infectious.

About HIV/AIDS | HIV Basics | HIV/AIDS | CDC

What is AIDS? If a person develops certain serious opportunistic infections or diseases – as a result of damage to their immune system from advanced stage 3 HIV infection – they are said to have AIDS. If you have advanced HIV (with AIDS-defining symptoms), it's important to get the right treatment as soon as possible. With treatment a person can recover from AIDS-related infections and diseases, and bring HIV under control.

Symptoms and stages of HIV infection | Avert

As HIV lowers the CD4 cell count, the immune system weakens. A typical adult's CD4 count is 500 to 1,500 per cubic millimeter. A person with a count below 200 is considered to have AIDS. How...

HIV and AIDS: Causes, Symptoms, Treatments, and More

What Is AIDS? AIDS is the late stage of HIV infection that occurs when the body's immune system is badly damaged because of the virus. In the U.S., most people with HIV do not develop AIDS because taking HIV medicine every day as prescribed stops the progression of the disease. A person with HIV is considered to have progressed to AIDS when:

What Are HIV and AIDS? | HIV.gov

HIV stands for human immunodeficiency virus. It weakens a person's immune system by destroying important cells that fight disease and infection. No effective cure exists for HIV. But with proper medical care, HIV can be controlled.

HIV Basics | HIV/AIDS | CDC

A complex network of specialized cells, tissues, and organs that recognize and defend the body from foreign substances, primarily disease-causing microorganisms such as bacteria, viruses, parasites, and fungi. Organs and tissues of the immune system include the bone marrow, spleen, thymus, tonsils, mucous membranes, and skin. Granulocytes, macrophages, and T lymphocytes are examples of ...

Immune System | ClinicalInfo

Other common HIV coinfections include hepatitis B and C in some populations. HIV infection can result in a range of health problems. As people living with HIV age and live longer, non-AIDS defining illnesses are becoming more common. These include heart disease, cancer and diabetes.
