Rather, in doing physics, we use mathematics as a tool to help us understand nature. So, after you obtain a numerical answer, you should always assess its significance: Check your units. If the units of the answer are incorrect, then an error has been made and you should go back over your previous steps to find it.

Kinematic equations relate the variables of motion to one another. Each equation contains four variables. The variables include acceleration (a), time (t), displacement (d), final velocity (vf), and initial velocity (vi). If values of three variables are known, then the others can be calculated using the equations. This page demonstrates the process with 20 sample problems and accompanying ...

Kinematic Equations: Sample Problems and Solutions

Some of the major unsolved problems in physics are theoretical, meaning that existing theories seem incapable of explaining a certain observed phenomenon or experimental result. The others are experimental, meaning that there is a difficulty in creating an experiment to test a proposed theory or investigate a phenomenon in greater detail.

In math, the rule is to always round the digit 5 up, but the rule in physics is to always round the digit 5 towards the even. Thus, you would round the numbers 15, 35, 55, and 75 up, but you would round 25, 45, 65, and 85 down in physics. Physicists do this because always rounding the 5 up would create small biases in their data.
