Precipitation refers to a chemical reaction that occurs in aqueous solution when two ions bond together to form an insoluble salt, which is known as the precipitate. A precipitation reaction can occur when two solutions containing different salts are mixed, and a cation/anion pair in the resulting combined solution forms an insoluble salt; this salt

Lab #6 - Precipitation Reactions This week's lab focuses on one of the more challenging concepts for new chemistry students: predicting the products of a double replacement reaction. More often than not, these reactions will produce a precipitate; a solid substance that forms when two aqueous solutions are combined.

Precipitation Reactions. Here AB and CD are usually aqueous ionic compounds (or acids) consisting of aqueous ions (A^+ and B^- , C^+ and D^-). When a double replacement reaction occurs, the cations and anions switch partners, resulting in the formation of two new ionic compounds AD and CB, one of which is in the solid state.
