essentially a water story," says Lall.

Evaporation. Warmer air can hold more moisture than cool air.

As a result, in a warmer world, the air will suck up more

water from oceans, lakes, soil and plants.

The drier conditions this air leaves behind could negatively affect drinking water supplies and agriculture.

How Climate Change

Impacts Our Water

Agriculture is also a leading source of water pollution, from nutrient runoff, agricultural chemicals and livestock manure.

Nutrient runoff into bodies of water promotes the growth of algal blooms, and this is exacerbated by warmer water temperatures resulting from climate change. These algal blooms hurt local economies.

Climate change can disrupt food availability, reduce access to food, and affect food quality. [14] For example, projected increases in temperatures, changes in precipitation patterns, changes in extreme weather events, and reductions in water availability may all result in reduced agricultural productivity.
