The displacement, velocity, acceleration values are obtained on different landing velocities by numerical simulations using MATLAB/Simulink. Using the same parameters of the aircraft, landing gear and tire, the dynamic analysis was also done in ABAQUS. The results obtained by the nonlinear vibration analysis using the developed model in MATLAB/Simulink have close agreement with the results obtained from ABAQUS.

Although the use of hierarchical elements can effectively reduce the required number of DOFs in a nonlinear vibration analysis, the element matrices should be integrated analytically to eliminate the numerical integration errors when high-order oscillating polynomials are involved as shape functions (Woo et al. 2003). Only Mindlin plates of rectangular, skew and trapezoidal shapes can be easily integrated analytically when hierarchical elements are employed in nonlinear vibration analysis.
