Radial Piston Engine Diagram

The radial engine is a reciprocating type internal combustion engine configuration in which the cylinders "radiate" outward from a central crankcase like the spokes of a wheel. It resembles a stylized star when viewed from the front, and is called a "star engine" in some languages (German Sternmotor, French moteur en étoile, Japanese 放射状エンジン (hoshigata enjin), Italian motore stellare).

The radial engine has the same sort of pistons, valves and spark plugs that any four-stroke engine has. The big difference is in the crankshaft . Instead of the long shaft that's used in a multi-cylinder car engine, there is a single hub -- all of the piston's connecting rods connect to this hub.

The stroke of each piston is caused by an eccentric drive shaft or an external eccentric tappet (e.g., stroke ring). When filling the workspace of the pumping pistons from "inside" (e.g., over a hollow shaft) it is called an inside impinged (but outside braced) radial piston pump (picture 1).If the workspace is filled from "outside" it's called an outside impinged radial piston pump (but ...

But radial engines do have downsides. Their massive frontal area creates drag and limits pilot visibility. Radial engines need significant airflow to cool the cylinders, so engine placement on the aircraft is limited. It's nearly impossible to install a multi-valve valve train - so nearly all radial engines use a two-valve system, limiting power.

As with the People's Car, the vast majority of piston aircraft engines in service today use the Otto-cycle, invented by Nikolaus August Otto in 1876. Also called four stroke or four cycle, these engines contain a cylinder into which is fitted a piston; the piston acts on a crankshaft through a connecting rod.
