For series circuits, voltage gets dropped at each component, but the current is same for all of them, as the path is continuous. So, series circuits are also called Voltage dividers. For parallel circuits, it's the opposite, as voltage will flow the same in each path, the current get's dropped/separated for each path.

difference between series and parallel circuit - Brainly.in

The resistor (R 1) between A and B would be parallel with the equivalent resistance of the other two, which are essentially in series. Then, R 2 and R 3 have an equivalent resistance: $R_E = R_2 + R_3$. R_E and R 1 are parallel, therefore the equivalent resistance is the reciprocal of the sum of the reciprocals of R_E and R 1.

Parallel Circuits. Combination Circuits. Previously in Lesson 4, it was mentioned that there are two different ways to connect two or more electrical devices together in a circuit. They can be connected by means of series connections or by means of parallel connections. When all the devices in a circuit are connected by series connections, then the circuit is referred to as a series circuit.

Notice that in some nodes (like between R 1 and R 2) the current is the same going in as at is coming out. At other nodes (specifically the three-way junction between R 2, R 3, and R 4) the main (blue) current splits into two different ones. That's the key difference between series and parallel!. Series Circuits Defined. Two components are in series if they share a common node and if the same ...
